# Talk outline

- Introduction and historical background
- Details of the GOLLUM programme
- Submitting data
- Viewing data live
- Provisional results:
  - 2021-2023
  - 2004-2014
    - Coping with seemingly drifting cylinders
- Other O<sub>2</sub> intercomparison programmes
- Future outlook: suggestions and plans

# Introduction

- There is no official WMO calibration scale for O<sub>2</sub>/N<sub>2</sub> measurements
  - Mostly because of a lack of resources (money, people, time) for anyone to maintain such a scale
- Many (but not all) labs are unofficially on the “Scripps O<sub>2</sub> scale”
  - But “Scripps O<sub>2</sub> scale” means different things for different labs
  - There are no established protocols for maintaining one’s links to this scale
- As a result, combining atmospheric O<sub>2</sub>/N<sub>2</sub> datasets from different labs is problematic, and even impossible
  - This stymies scientific progress and collaboration
- The GOLLUM programme was initiated in 2003 (by Andrew Manning and Ralph Keeling) to start to address these deficiencies
  - Following agreement at the GGMT-2003 meeting in Toronto, Canada

# WORLD METEOROLOGICAL ORGANIZATION GLOBAL ATMOSPHERE WATCH

No. 148

**Report of the Eleventh WMO/IAEA Meeting of  
Experts on Carbon Dioxide Concentration and  
Related Tracer Measurement Techniques**

**(Tokyo, Japan, 25 – 28 September 2001)**

### 3) O<sub>2</sub>/N<sub>2</sub> CALIBRATION

Intercalibration activities be undertaken to improve the usefulness of O<sub>2</sub>/N<sub>2</sub> measurements, which are now being conducted by a growing number of laboratories world-wide. At present, there are no absolute standards for atmospheric O<sub>2</sub>/N<sub>2</sub> ratio, and each laboratory has reported results relative to individual laboratory reference gases. The scientific value of O<sub>2</sub>/N<sub>2</sub> measurements would be largely enhanced if measures were taken to bring the observations onto a common scale, with a precision of a few per meg, and if this scale could be tied to absolute standards, with an absolute accuracy of 5 per meg or better. Both tasks are very challenging, however, and it is not clear how best to implement such measures at this time. What is needed at present are creative efforts on the part of individual laboratories or among groups of laboratories to test strategies for intercalibration and to test approaches to standards development. At the Scripps Institution of Oceanography, for example, a program is underway to develop air standards for O<sub>2</sub>/N<sub>2</sub> ratio analysis based on gravimetry. Another identifiable need is having several stations worldwide where samples can be collected in parallel for several laboratories, as this will aid in establishing the offsets between the individual laboratory scales in the absence of a common scale. Two such stations already exist: (1) Cape Grim station, where samples are currently being collected for laboratories at Princeton, Scripps, and CSIRO, and (2) the Scripps Pier in La Jolla, California, where samples are being collected for Princeton and Scripps.

## 12<sup>th</sup> WMO/IAEA MEETING OF EXPERTS ON CARBON DIOXIDE CONCENTRATION AND RELATED TRACERS MEASUREMENT TECHNIQUES

(Toronto, Canada, 15-18 September 2003)

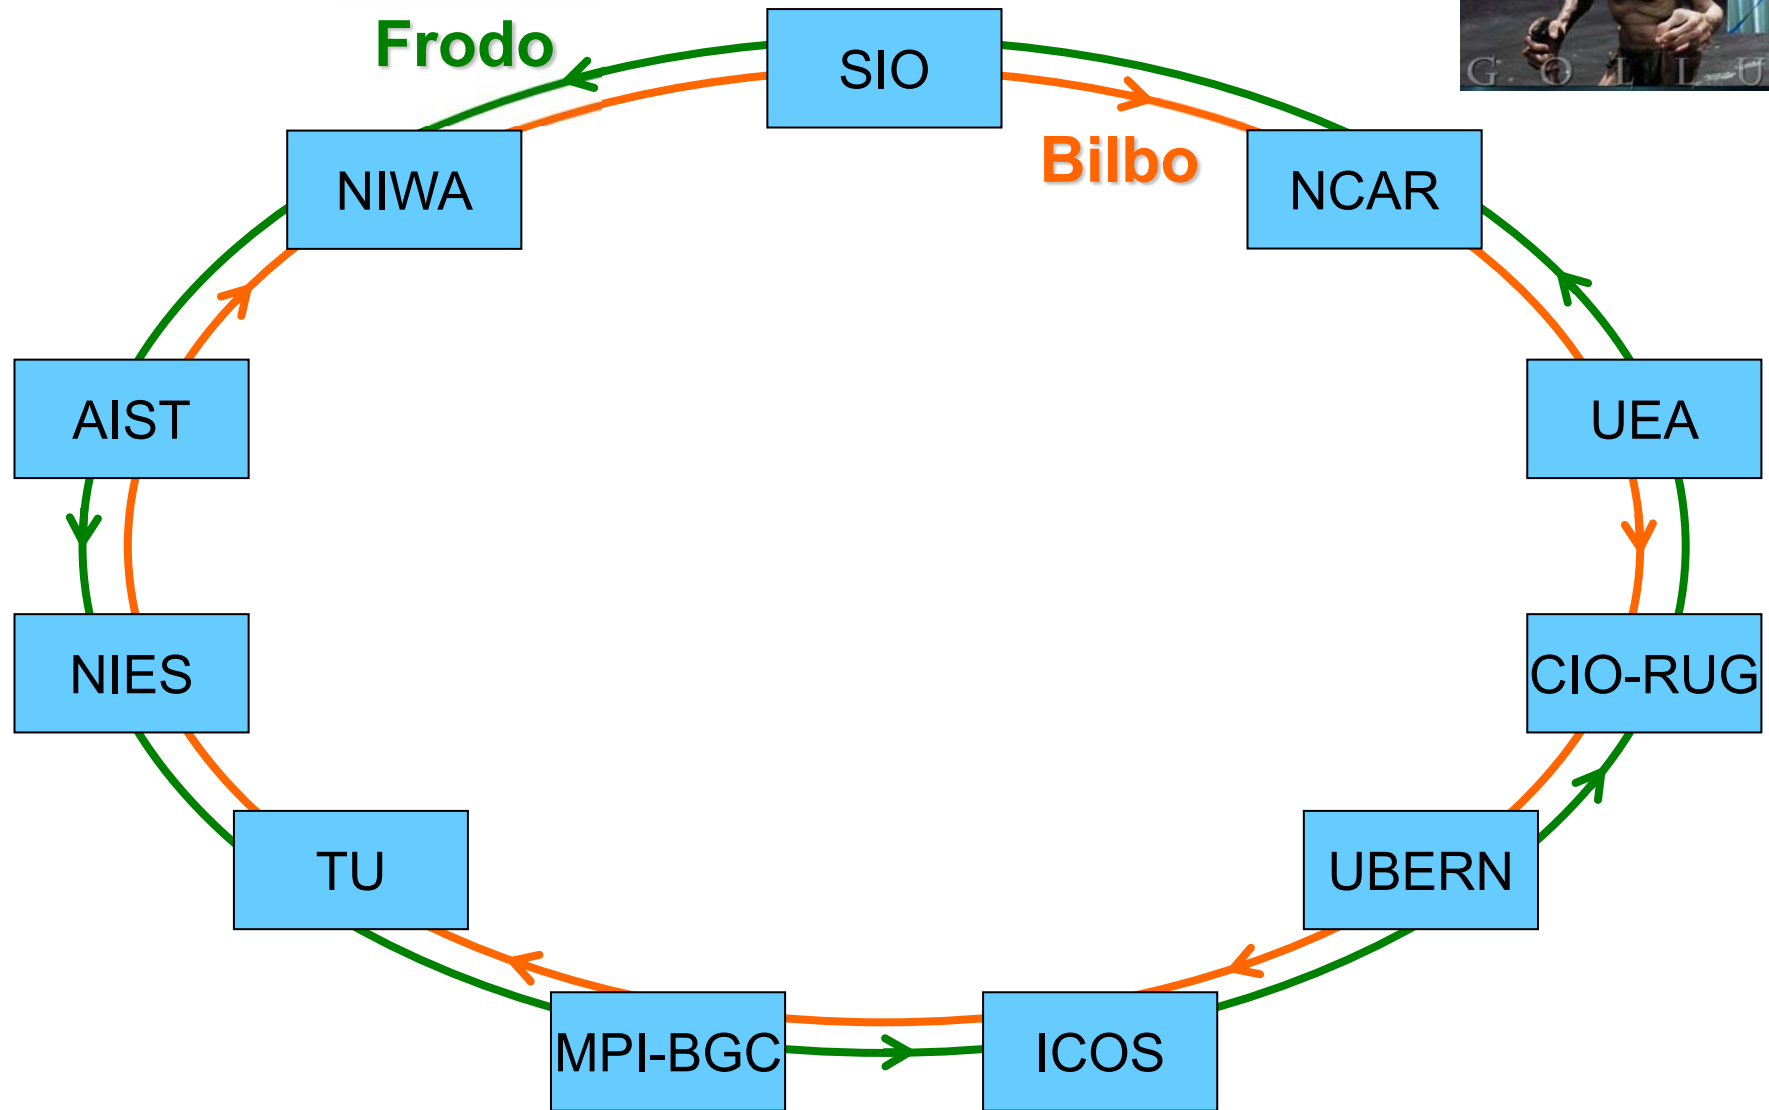

# Details of the GOLLUM programme

- Rotation of cylinders started in 2004, for 11 years
  - Stopped in 2014 as cylinders needed to be refilled
  - Refilling did not happen until 2020 – Tim Lueker has guaranteed this will never reoccur
- Rotations resumed in 2021, continuing indefinitely
- Rotations consist of 2 sets of 3 cylinders, referred to as “Bilbo” and “Frodo” sets
  - The two sets rotate in opposite directions around the world
  - NOTE: The same 6 cylinders are used in both time periods
    - BUT 2 CYLINDERS HAVE SWITCHED THEIR AFFILIATION between Frodo and Bilbo!
    - Do not let this confuse you!
- Species included: O<sub>2</sub>/N<sub>2</sub>, CO<sub>2</sub>, Ar/N<sub>2</sub>
- 2004-2014:
  - 10 participating laboratories
- 2021-present:
  - 11 participating laboratories in 7 countries
    - AIST + ICOS added; PU stopped
- **GOLLUM programme has never had any source of funding!!**

## Background on Atmospheric oxygen measurement

Atmospheric oxygen ( $O_2$ ) measurements are used to provide insight and quantitative understanding of the global carbon cycle [Bender *et al.*, 1996; Bender *et al.*, 1998; Keeling and Shertz, 1992]. More recently they have been used in other applications such as understanding air-sea gas exchange [Keeling *et al.*, 1998] and critiquing ocean biogeochemical and atmospheric transport models [Battle *et al.*, 2006; Stephens *et al.*, 1998].

Atmospheric  $O_2$  measurements were first established in 1988 by Professor Ralph Keeling at Scripps Institution of Oceanography [Keeling, 1988], and are now made at ~12 laboratories around the world, and at ~25 field stations. The measurements are extremely challenging. For example, the relative precision required, as stipulated by the World Meteorological Organisation Global Atmosphere Watch (WMO/GAW), is 0.0001%. By contrast, the WMO/GAW-required precision for  $CO_2$ , also considered challenging, is only 0.03%.

## Disclaimer:

1. All results here are preliminary and provisional
2. These data must NOT be used to adjust any laboratory's calibration scales.
3. If you wish to use or present these data for any reason, please contact Andrew Manning:  
[A.Manning@uea.ac.uk](mailto:A.Manning@uea.ac.uk)

# Viewing data: Live website demonstration

<https://gollum.uea.ac.uk/results/index.php>

- Note: unusual error bars (for summary average plots)
- “Zero” refers to SIO measurements in Oct/Nov2020
  - Or Sep2004, for the older period
- Stations with calibration scale offsets are indicated in legend
- Diamonds = Frodo; Circles = Bilbo
- Dashed horizontal lines = WMO compatibility goals

# Very preliminary and provisional results

- **VERY IMPORTANT:**

- GOLLUM data are currently a mess, sorry!
- Many different calibration scales; sometimes not even known
- Much data not updated to latest scales
- Some data not yet received
- Some obvious errors, which labs need more time to investigate

- **Please do not draw any negative conclusions from the following slides!**

- These slides are only to demonstrate some of the analyses that are possible with GOLLUM data

# Other O<sub>2</sub> intercomparison programmes

- “Sausage” flask intercomparison
  - GOLLUM ran such a programme for a few years in the 2000’s
  - Any interest in restarting this?
- Co-located “supersite” measurements
  - Flasks from two organisations: e.g. ALT (SIO + MPI-BGC)
  - Continuous and flasks: e.g. LJO
  - Do we want more of these?
- WMO Round Robins
  - Britt (NCAR) measures these for O<sub>2</sub>/N<sub>2</sub>, so these act like a GOLLUM snapshot
    - You need to tell NOAA (Duane) that you want to do O<sub>2</sub>/N<sub>2</sub> analyses
    - Figure shows 2014/15 WMO RR:

# Future outlook: Suggestions and plans (i)

- Establish recommendations for best practice to maintain links to SIO O<sub>2</sub> scale
  - A) For those who have Scripps Primary cylinders
  - B) For those who maintain their own in-house scales
- GOLLUM cylinders **\*\*must\*\*** rotate faster
  - 5 weeks in each laboratory (+ shipping time)
  - Average so far = ~8 weeks
- GOLLUM data **\*\*must\*\*** be submitted timely
  - 5 weeks after analyses
- Many labs **\*\*must\*\*** update to SIO 2017 O<sub>2</sub> scale
  - And any successor SIO O<sub>2</sub> scale
  - Suggested goal to do so: 1 year after scale is released
  - My lab is also very guilty here!!
- New scale releases from SIO should be announced on GOLLUM mailing list
  - (To add/remove people to GOLLUM (or APO) mailing lists – email Andrew)
- **I welcome feedback and criticism** – website, protocols, data analyses...

# Future outlook: Suggestions and plans (ii)

- Next steps – my request:
  - Everyone to quality control their GOLLUM data, including checking how it looks on the website
  - Where relevant, everyone to update to SIO 2017 O<sub>2</sub> scale
    - And apply next SIO scale update promptly
  - Then we will look again at linear + quadratic offsets
    - Any suggestions for alternative offset analyses?
- What should we do about CO<sub>2</sub>, given the scale differences?
- Have not looked at mole fraction dependencies, but this will be limited by the mole fractions of the cylinders:
  - 2021-onwards will be better...
- Cylinders with dip tubes?
- Finally, how to use GOLLUM results to merge datasets for the data users???
  - In “Cucumbers” ICP, we quantified average lab offsets over 5-year timeframes
